Art Unit: 1657

The RCE Request received 3/12/07 and the after final amendment received 2/14/07 have been entered and claims 1, 4, 12 are currently pending in this application.

In view of the arguments presented and amendments to the claims, the rejection of record under 35 USC 112, second paragraph, is hereby withdrawn.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless —

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 4, 12 are rejected under 35 U.S.C. 102(b) as being anticipated by Morris.

Morris (5,173,434) entitled "Measurement of Color Reactions by Monitoring a Change of Fluorescence" teaches in column 2 last paragraph, fluorescence quenching is described for fluorogenic substrates for assaying enzymes. The synthetic substrate contains a quenching and fluorescing group which is generated. In column 4 line 24 the assay detects the concentration of substances in a colorimetric, turbidimetric or nephelometric reaction with a reader. In column 5 first full paragraph, chromogenic reagents are disclosed which have an absorption spectrum that overlaps the spectrum of a fluorophore. See the claims.

All the features of the claims are taught by the above reference for the same function as claimed.

Applicant's arguments filed 3/12/07 have been fully considered but they are not persuasive.

Applicant argues that the present invention specifies the indicator physically interacts with the light emitting moiety which is different from quenching or turbidity which relies upon absorbing the light already emitted at a distance.

It is the examiner's position that Morris clearly teaches fluorescence quenching which encompasses the indicator physically interacts with the light emitting moiety. In column 2, lines 51-53, "The general principle of fluorescence quenching has been accepted as a way to detect or determine enzymatic or chemical reactions." A reading of the amended claims reveals no point of novelty.
